3 Introduction

The following document details the Module Interface Specifications for [Fill in your project name and description —SS]

Complementary documents include the System Requirement Specifications and Module Guide. The full documentation and implementation can be found at [provide the url for your repo —SS]

4 Notation

[You should describe your notation. You can use what is below as a starting point. —SS]

The structure of the MIS for modules comes from Hoffman and Strooper (1995), with the addition that template modules have been adapted from Ghezzi et al. (2003). The mathematical notation comes from Chapter 3 of Hoffman and Strooper (1995). For instance, the symbol $:=$ is used for a multiple assignment statement and conditional rules follow the form $(c_1 \Rightarrow r_1 | c_2 \Rightarrow r_2 | \dots | c_n \Rightarrow r_n)$.

The following table summarizes the primitive data types used by Software Engineering.

Data Type	Notation	Description
character	char	a single symbol or digit
integer	\mathbb{Z}	a number without a fractional component in $(-\infty, \infty)$
natural number	\mathbb{N}	a number without a fractional component in $[1, \infty)$
real	\mathbb{R}	any number in $(-\infty, \infty)$

The specification of Software Engineering uses some derived data types: sequences, strings, and tuples. Sequences are lists filled with elements of the same data type. Strings are sequences of characters. Tuples contain a list of values, potentially of different types. In addition, Software Engineering uses functions, which are defined by the data types of their inputs and outputs. Local functions are described by giving their type signature followed by their specification.

5 Module Decomposition

The following table is taken directly from the Module Guide document for this project.

Level 1	Level 2
Hardware-Hiding	
	Input Parameters
	Output Format
	Output Verification
Behaviour-Hiding	Temperature ODEs
	Energy Equations
	Control Module
	Specification Parameters Module
Software Decision	Sequence Data Structure
	ODE Solver
	Plotting

Table 1: Module Hierarchy

6 MIS of [Module Name —SS]

[Use labels for cross-referencing —SS]

[You can reference SRS labels, such as R???. —SS]

[It is also possible to use L^AT_EX for hyperlinks to external documents. —SS]

6.1 Module

[Short name for the module —SS]

6.2 Uses

6.3 Syntax

6.3.1 Exported Constants

6.3.2 Exported Access Programs

Name	In	Out	Exceptions
[accessProg —SS]	-	-	-

6.4 Semantics

6.4.1 State Variables

[Not all modules will have state variables. State variables give the module a memory. —SS]

6.4.2 Environment Variables

[This section is not necessary for all modules. Its purpose is to capture when the module has external interaction with the environment, such as for a device driver, screen interface, keyboard, file, etc. —SS]

6.4.3 Assumptions

[Try to minimize assumptions and anticipate programmer errors via exceptions, but for practical purposes assumptions are sometimes appropriate. —SS]

6.4.4 Access Routine Semantics

[accessProg —SS]():

- transition: [if appropriate —SS]
- output: [if appropriate —SS]

- exception: [if appropriate —SS]

[A module without environment variables or state variables is unlikely to have a state transition. In this case a state transition can only occur if the module is changing the state of another module. —SS]

[Modules rarely have both a transition and an output. In most cases you will have one or the other. —SS]

6.4.5 Local Functions

[As appropriate —SS] [These functions are for the purpose of specification. They are not necessarily something that is going to be implemented explicitly. Even if they are implemented, they are not exported; they only have local scope. —SS]

7 MIS of Command Execution Layer

7.1 Module

Executes verified, mapped commands on the host device via the browser control bridge. Responsible for dispatch, cancellation, basic guardrails, timeout handling, and result reporting.

7.2 Uses

Browser control/automation client (e.g., `BrowserUse` bridge); OS process APIs; timer utilities; audit logger; configuration store for timeouts and retries.

7.3 Syntax

7.3.1 Exported Constants

None.

7.3.2 Exported Access Programs

Name	In	Out	Exceptions
CommandExecLayer	backend: Client, timeout_s: int	self	-
execute	cmd: ExecCmd	Result	PermissionError, TimeoutError, ExecError
cancel	cmd_id: UUID	bool	NotFoundError
status	cmd_id: UUID	ExecStatus	NotFoundError
validate	cmd: ExecCmd	bool	-
map_to_backend	cmd: ExecCmd	BackendReq	MappingError
rollback	cmd_id: UUID	bool	ExecError

7.4 Semantics

7.4.1 State Variables

- `pending_q: map[UUID] → ExecCtx` — commands in flight
- `default_timeout_s: int` — global timeout for executions
- `retries: int` — max retry attempts for transient failures
- `backend: Client` — handle to browser automation bridge
- `audit: Logger` — sink for execution logs

7.4.2 Environment Variables

- `BROWSER_BRIDGE_URL` — connection string for automation client
- `EXEC_HARD_LIMIT_S` — absolute upper bound on execution time
- `LOG_LEVEL` — audit verbosity

7.4.3 Assumptions

7.4.4 Access Routine Semantics

`CommandExecLayer(backend, timeout_s):`

- transition: initialize `pending_q`, set `default_timeout_s`, bind `backend`, configure `audit`
- output: initialized instance
- exception: -

`execute(cmd):`

- transition: add to `pending_q`; invoke `map_to_backend`; dispatch to `backend`; update status; remove on completion
- output: `Result` with success flag, message, and optional payload
- exception: `PermissionError` if disallowed; `TimeoutError` if exceeds limits; `ExecError` on backend failure

`cancel(cmd_id):`

- transition: signal cancellation to backend; mark context as cancelled; remove from `pending_q`
- output: `true` if cancelled; otherwise `false`
- exception: `NotFoundError` if `cmd_id` not tracked

`status(cmd_id):`

- transition: none
- output: `ExecStatus` in {queued, running, succeeded, failed, cancelled}
- exception: `NotFoundError` if unknown

`validate(cmd):`

- transition: none

- output: `true` iff command matches allowed action set and guardrails (e.g., requires-confirmation flags met)
- exception: -

`map_to_backend(cmd):`

- transition: none
- output: `BackendReq` (normalized request for the bridge)
- exception: `MappingError` if no mapping exists

`rollback(cmd_id):`

- transition: attempt compensating operation (e.g., reopen tab, revert text entry)
- output: `true` on success; otherwise `false`
- exception: `ExecError` if rollback fails

7.4.5 Local Functions

- `start_timer(ctx)` — begin timeout tracking on a context
- `complete(ctx, result)` — finalize status, log, and cleanup
- `is_allowed(cmd)` — check guardrails and policy
- `retryable(err)` — decide if backend error can be retried
- `to_backend(payload)` — format request for bridge

8 MIS of Error Feedback

8.1 Module

Displays user-friendly error messages and recovery prompts. Surfaces execution issues, suggests next steps, and routes critical errors to support logs.

8.2 Uses

UI notification layer; audit logger; configuration store for messages; localization service (optional).

8.3 Syntax

8.3.1 Exported Constants

None.

8.3.2 Exported Access Programs

Name	In	Out	Exceptions
ErrorFeedback	notifier: UiClient	self	-
show_error	code: string, detail: string	-	-
show_recovery	cmd_id: UUID, options: string list	-	-
dismiss	feedback_id: UUID	bool	-
log	event: ErrorEvent	-	-

8.4 Semantics

8.4.1 State Variables

- active: map[UUID] to FeedbackItem — currently visible items
- notifier: UiClient — handle to UI notifications

8.4.2 Environment Variables

- DEFAULT_LANG — fallback locale
- ERROR_COPY_PATH — message templates location

8.4.3 Assumptions

UI client is available and permitted to display notifications.

8.4.4 Access Routine Semantics

ErrorFeedback(notifier):

- transition: initialize active; bind notifier
- output: initialized instance
- exception: -

```

show_error(code, detail):
    • transition: create and register a feedback item in active; display via notifier
    • output: -
    • exception: -

show_recovery(cmd_id, options):
    • transition: render recovery prompt with provided options
    • output: -
    • exception: -

dismiss(feedback_id):
    • transition: remove from active; instruct UI to hide
    • output: true if removed; otherwise false
    • exception: -

log(event):
    • transition: write event to audit log
    • output: -
    • exception: -

```

8.4.5 Local Functions

- `format_message(code, detail)` — produce a concise message
- `make_recovery(options)` — build prompt content

9 MIS of BrowserController

9.1 Module

Handles interaction with the browser controller: sends backend requests, receives statuses, and streams results back to higher layers.

9.2 Uses

Browser automation bridge client; transport layer; timer utilities; audit logger.

9.3 Syntax

9.3.1 Exported Constants

None.

9.3.2 Exported Access Programs

Name	In	Out	Exceptions
BrowserController	bridge: Client, timeout_s: int	self	-
send	req: BackendReq	BackendResp	TimeoutError, TransportError
get_status	cmd_id: UUID	ExecStatus	NotFoundError
cancel	cmd_id: UUID	bool	NotFoundError
open_session	user_id: UUID	SessionId	TransportError
close_session	session_id: SessionId	bool	TransportError

9.4 Semantics

9.4.1 State Variables

- `bridge: Client` — transport to the browser controller
- `default_timeout_s: int` — call timeout
- `sessions: set[SessionId]` — open sessions

9.4.2 Environment Variables

- `BROWSER_BRIDGE_URL` — endpoint for the controller

9.4.3 Assumptions

Controller endpoint is reachable and authenticated.

9.4.4 Access Routine Semantics

`BrowserController(bridge, timeout_s):`

- transition: set `bridge`, `default_timeout_s`, clear `sessions`
- output: initialized instance
- exception: -

```

send(req):
    • transition: none
    • output: BackendResp from controller
    • exception: TimeoutError, TransportError on failures

get_status(cmd_id):
    • transition: none
    • output: current ExecStatus
    • exception: NotFoundError if unknown

cancel(cmd_id):
    • transition: signal cancellation upstream
    • output: true if accepted
    • exception: NotFoundError if unknown

open_session(user_id):
    • transition: create session; add to sessions
    • output: SessionId
    • exception: TransportError if controller rejects

close_session(session_id):
    • transition: close remotely; remove from sessions
    • output: true on success; otherwise false
    • exception: TransportError on failure

```

9.4.5 Local Functions

- `with_timeout(call)` — wrap a bridge call with timeout
- `normalize(resp)` — normalize controller response

10 MIS of Session Manager

10.1 Module

Manages ongoing user sessions and their states: start, stop, track activity, and associate commands with sessions.

10.2 Uses

Persistent store or cache; clock utilities; audit logger.

10.3 Syntax

10.3.1 Exported Constants

None.

10.3.2 Exported Access Programs

Name	In	Out	Exceptions
SessionManager	store: Store, ttl_s: int	self	-
start	user_id: UUID	SessionId	StoreError
stop	session_id: SessionId	bool	StoreError
get	session_id: SessionId	SessionState	NotFoundError
attach_command	session_id: SessionId, cmd_id: UUID	bool	NotFoundError
set_state	session_id: SessionId, state: SessionState	bool	StoreError

10.4 Semantics

10.4.1 State Variables

- `store: Store` — persistence for sessions
- `ttl_s: int` — idle expiry threshold
- `index: map[SessionId] to SessionState` — in-memory cache

10.4.2 Environment Variables

- `SESSION_TTL_S` — default idle timeout

10.4.3 Assumptions

Store operations are atomic per session key.

10.4.4 Access Routine Semantics

`SessionManager(store, ttl_s):`

- transition: set fields; warm cache from store if available
- output: initialized instance
- exception: -

`start(user_id):`

- transition: create session; write to store; cache in `index`
- output: `SessionId`
- exception: `StoreError` on failure

`stop(session_id):`

- transition: mark closed; evict from `index`; update store
- output: `true` on success; otherwise `false`
- exception: `StoreError` on failure

`get(session_id):`

- transition: none
- output: current `SessionState`
- exception: `NotFoundError` if unknown

`attach_command(session_id, cmd_id):`

- transition: append command reference to session state
- output: `true` if attached
- exception: `NotFoundError` if session unknown

`set_state(session_id, state):`

- transition: update state in cache and store
- output: `true` if updated
- exception: `StoreError` on write failure

10.4.5 Local Functions

- `now()` — current timestamp
- `expired(state)` — checks idle expiry

11 MIS of Error Handling & Recovery Module

11.1 Module

Classifies errors, applies retry and backoff policies, and coordinates recovery or compensation actions to return the system to a consistent state.

11.2 Uses

Policy store; timer/backoff utilities; audit logger; command execution layer; browser controller.

11.3 Syntax

11.3.1 Exported Constants

None.

11.3.2 Exported Access Programs

Name	In	Out	Exceptions
ErrorHandler	<code>policy: Policy</code>	<code>self</code>	-
handle	<code>err: ExecError,</code> <code>ctx: ExecCtx</code>	<code>ActionResult</code>	-
retry	<code>cmd_id: UUID</code>	<code>bool</code>	<code>PolicyError</code>
compensate	<code>cmd_id: UUID</code>	<code>bool</code>	<code>ExecError</code>
classify	<code>err: ExecError</code>	<code>ErrorClass</code>	-
record	<code>err: ExecError,</code> <code>ctx: ExecCtx</code>	<code>UUID</code>	-

11.4 Semantics

11.4.1 State Variables

- `policy: Policy` — retry and compensation rules
- `history: map[UUID] to ErrorEvent` — recent errors
- `backoff: map[UUID] to int` — current backoff in seconds

11.4.2 Environment Variables

- `MAX_ATTEMPTS` — hard cap for attempts
- `BASE_BACKOFF_S` — initial delay

11.4.3 Assumptions

Compensation actions are idempotent or guarded.

11.4.4 Access Routine Semantics

`ErrorHandler(policy):`

- transition: set `policy`; clear `history`, `backoff`
- output: initialized instance
- exception: -

`handle(err, ctx):`

- transition: classify; decide action (retry, compensate, fail); update `history`, `backoff`
- output: `ActionResult` describing action taken
- exception: -

`retry(cmd_id):`

- transition: schedule retry with policy backoff
- output: `true` if scheduled
- exception: `PolicyError` if retries exhausted

`compensate(cmd_id):`

- transition: execute compensation; update state
- output: `true` on success; otherwise `false`
- exception: `ExecError` if compensation fails

`classify(err):`

- transition: none
- output: `ErrorClass` such as transient, permanent, or user
- exception: -

- ```

record(err, ctx):
 • transition: persist error event; update history
 • output: event identifier UUID
 • exception: -

```

#### 11.4.5 Local Functions

- `calc_backoff(cmd_id)` — compute next delay
- `is_idempotent(cmd_id)` — check compensation safety

## 12 MIS of Storage Management Module — M12

**Module:** Storage Management Module

### 12.1 Uses:

- Encryption Manager (M16) for encryption/decryption at rest and in transit (R16.3).
- Credential Manager (M15) for authenticated access to user-specific data (R16.1).
- AuditLogger (M14) to record storage and retrieval events (R16.4).
- UserProfileManager (M13) for storing personalized ASR profiles and preferences.

### 12.2 Syntax:

#### 12.2.1 Exported Constants:

- `MAX_STORAGE_LIMIT` = 5GB per user session (configurable).
- `BACKUP_INTERVAL` = 24 hours.
- `RETENTION_PERIOD` = 90 days (per R16.3 Privacy Requirements).

#### 12.2.2 Exported Access Programs:

| Name                               | In                                  | Out                         | Exceptions                          |
|------------------------------------|-------------------------------------|-----------------------------|-------------------------------------|
| <code>storeTranscript</code>       | <code>transcriptData, userID</code> | <code>confirmationID</code> | <code>StorageWriteException</code>  |
| <code>retrieveTranscript</code>    | <code>transcriptID, userID</code>   | <code>transcriptData</code> | <code>DataNotFoundException</code>  |
| <code>backupData</code>            | <code>userID</code>                 | <code>backupStatus</code>   | <code>BackupFailureException</code> |
| <code>enforceRetentionRules</code> | <code>policyConfig</code>           | <code>summaryReport</code>  | <code>RetentionException</code>     |

## 12.3 Semantics

### 12.3.1 State Variables:

- `storageRegistry`: maps user data identifiers to file metadata and encryption state.
- `backupSchedule`: list of active backups per user.
- `retentionPolicies`: retention rules derived from privacy configuration (R16.3).

### 12.3.2 Environment Variables:

- `DATABASE_URL`: location of secure storage database.
- `CLOUD_STORAGE_API`: API endpoint for encrypted cloud backups.

### 12.3.3 Assumptions:

- Encryption Manager (M16) is available for encrypting all stored data.
- User authentication is validated by Credential Manager (M15) before access.

### 12.3.4 Access Routine Semantics:

`storeTranscript(transcriptData, userID)`:

- **transition:** Adds a new entry to `storageRegistry`, encrypts transcript data via M16, and logs the event via M14.
- **output:** Returns confirmation ID.
- **exception:** `StorageWriteException` if quota exceeded or encryption fails.

`retrieveTranscript(transcriptID, userID)`:

- **output:** Returns decrypted transcript data.
- **exception:** `DataNotFoundException` if transcriptID not found or access denied.

`backupData(userID)`:

- **transition:** Performs encrypted backup of stored data to cloud (per R16.3).
- **output:** Backup status (success/failure).

`enforceRetentionRules(policyConfig)`:

- **transition:** Deletes expired or policy-violating entries from storage.
- **output:** Summary of removed or archived files.

#### **12.3.5 Local Functions:**

- `verifyBackupIntegrity(backupID)`
- `applyRetentionRule(fileMeta)`

## **13 MIS of User Profile Manager — M13**

**Module:** UserProfileManager

### **13.1 Uses:**

- Credential Manager (M15) for token validation and secure login (R16.1).
- Encryption Manager (M16) for encrypting stored profiles (R16.3).
- Storage Management Module (M12) for persistence.

### **13.2 Syntax:**

#### **13.2.1 Exported Access Programs:**

| Name                         | In                                | Out                         | Exceptions                            |
|------------------------------|-----------------------------------|-----------------------------|---------------------------------------|
| <code>createProfile</code>   | <code>userToken, initData</code>  | <code>profileID</code>      | <code>ProfileCreationException</code> |
| <code>loadPreferences</code> | <code>userID</code>               | <code>preferenceData</code> | <code>DataNotFoundException</code>    |
| <code>saveConsent</code>     | <code>userID, consentFlags</code> | <code>status</code>         | <code>ConsentException</code>         |

### **13.3 Semantics**

#### **13.3.1 State Variables:**

- `profiles`: map of `userID` → profile metadata.
- `preferences`: user personalization data (R12.2).
- `consentLog`: record of consent actions (R16.3).

#### **13.3.2 Assumptions:**

- Consent is required prior to storing personalization data (R16.3 Privacy).

### 13.3.3 Access Routine Semantics:

createProfile(userToken, initData):

- **transition:** Creates encrypted user profile and saves to M12 storage.
- **exception:** ProfileCreationException on invalid token.

saveConsent(userID, consentFlags):

- **transition:** Updates consentLog.
- **output:** Confirmation of saved consent (R16.3).

## 14 MIS of AuditLogger — M14

**Module:** AuditLogger

### 14.1 Uses:

- Encryption Manager (M16) for log encryption.
- Credential Manager (M15) for secure log access.

### 14.2 Syntax:

#### 14.2.1 Exported Access Programs:

| Name          | In                     | Out           | Exceptions                  |
|---------------|------------------------|---------------|-----------------------------|
| logEvent      | eventData, severity    | logID         | LogWriteException           |
| queryLogs     | filterParams, userRole | logRecords    | UnauthorizedAccessException |
| detectAnomaly | recentLogs             | anomalyReport | DetectionException          |

### 14.3 Semantics

#### 14.3.1 Access Routine Semantics:

logEvent(eventData, severity):

- **transition:** Writes signed and encrypted log entry per R16.4.

detectAnomaly(recentLogs):

- **output:** Triggers OutOfScopeHandler (M17) on suspicious events.

## 15 MIS of Credential Manager — M15

**Module:** Credential Manager (CredentialManagerImpl)

### 15.1 Uses:

- Encryption Manager (M16) for secure key storage.
- AuditLogger (M14) to record authentication attempts (R16.4).

### 15.2 Syntax:

#### 15.2.1 Exported Access Programs:

| Name             | In                 | Out          | Exceptions           |
|------------------|--------------------|--------------|----------------------|
| authenticateUser | username, password | sessionToken | AuthException        |
| validateToken    | sessionToken       | validity     | TokenException       |
| rotateKeys       | scheduleID         | status       | KeyRotationException |

### 15.3 Semantics

#### 15.3.1 Access Routine Semantics:

authenticateUser(username, password):

- **transition:** Validates credentials via password vault; issues signed token (R16.1).

rotateKeys(scheduleID):

- **transition:** Calls M16 to rotate key pairs per R16.3.

## 16 MIS of Encryption Manager — M16

**Module:** Encryption Manager (EncryptionManagerImpl)

### 16.1 Uses:

- None — foundational security service.

## 16.2 Syntax:

### 16.2.1 Exported Access Programs:

| Name            | In                  | Out        | Exceptions               |
|-----------------|---------------------|------------|--------------------------|
| encryptData     | plainData, keyID    | cipherData | EncryptionException      |
| decryptData     | cipherData, keyID   | plainData  | DecryptionException      |
| rotateKeys      | rotationPolicy      | result     | RotationFailureException |
| verifyIntegrity | dataBlob, signature | validFlag  | IntegrityException       |

## 16.3 Semantics

Implements R16.3 (Privacy Requirements): ensures all data is encrypted at rest/in transit.  
Implements R16.2 (Integrity): validates message hashes before use.

# 17 MIS of OutOfScopeHandler — M17

**Module:** OutOfScopeHandler

## 17.1 Uses:

- AuditLogger (M14) for incident reporting (R16.4).
- Command Mapping Module (M6) for validation of user commands.
- Error Handling & Recovery (M11) for rollback actions.

## 17.2 Syntax:

### 17.2.1 Exported Access Programs:

| Name            | In                   | Out              | Exceptions              |
|-----------------|----------------------|------------------|-------------------------|
| validateCommand | commandText, context | validationResult | InvalidCommandException |
| reportIncident  | incidentData         | reportID         | ReportFailureException  |
| recoverState    | sessionID            | status           | RecoveryException       |

## 17.3 Semantics

Implements R16.5 (Immunity Requirements): ensures robustness against unsafe operations.  
Integrates with M14 to log anomaly-triggered safety events.

### 17.3.1 Access Routine Semantics:

`validateCommand(commandText):`

- **transition:** Compares command against whitelist (policy from config).

`recoverState(sessionID):`

- **transition:** Restores safe prior system state through M11.

## **18 Appendix**

[Extra information if required —SS]

## Appendix — Reflection

[Not required for CAS 741 projects —SS]

The information in this section will be used to evaluate the team members on the graduate attribute of Problem Analysis and Design.

The purpose of reflection questions is to give you a chance to assess your own learning and that of your group as a whole, and to find ways to improve in the future. Reflection is an important part of the learning process. Reflection is also an essential component of a successful software development process.

Reflections are most interesting and useful when they're honest, even if the stories they tell are imperfect. You will be marked based on your depth of thought and analysis, and not based on the content of the reflections themselves. Thus, for full marks we encourage you to answer openly and honestly and to avoid simply writing "what you think the evaluator wants to hear."

Please answer the following questions. Some questions can be answered on the team level, but where appropriate, each team member should write their own response:

1. What went well while writing this deliverable?
2. What pain points did you experience during this deliverable, and how did you resolve them?
3. Which of your design decisions stemmed from speaking to your client(s) or a proxy (e.g. your peers, stakeholders, potential users)? For those that were not, why, and where did they come from?
4. While creating the design doc, what parts of your other documents (e.g. requirements, hazard analysis, etc), if any, needed to be changed, and why?
5. What are the limitations of your solution? Put another way, given unlimited resources, what could you do to make the project better? (LO\_ProbSolutions)
6. Give a brief overview of other design solutions you considered. What are the benefits and tradeoffs of those other designs compared with the chosen design? From all the potential options, why did you select the documented design? (LO\_Explores)
